Domain-level collection rate

Category n = all cohort domains in that category; purpose n = domains with an identifying-PI form of that purpose.
Zero-support contexts are labeled n=0. Provisional annotations; geography, date and crawl depth differ.

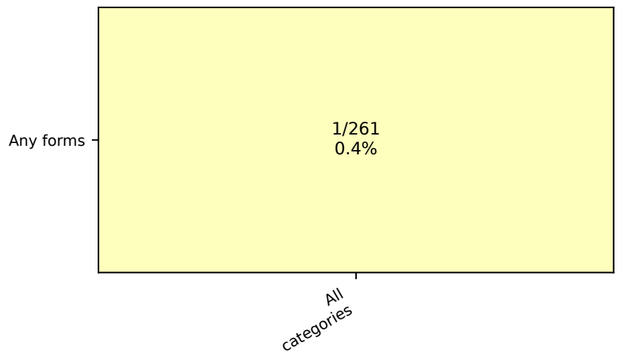

Figure 5 style | European follow-up | 261 domains

(a) Date of birth
Overall 5/261 = 1.9%

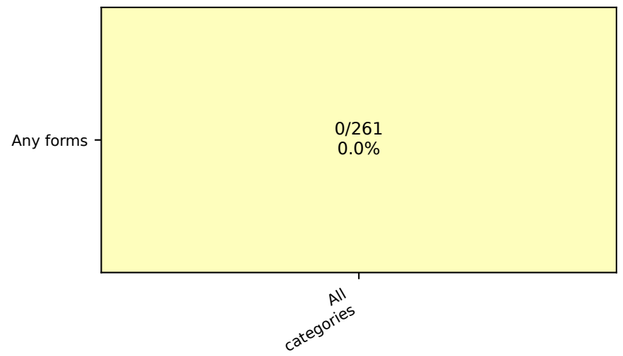

No additional contexts pass the paper filters

(b) Age
Overall 1/261 = 0.4%

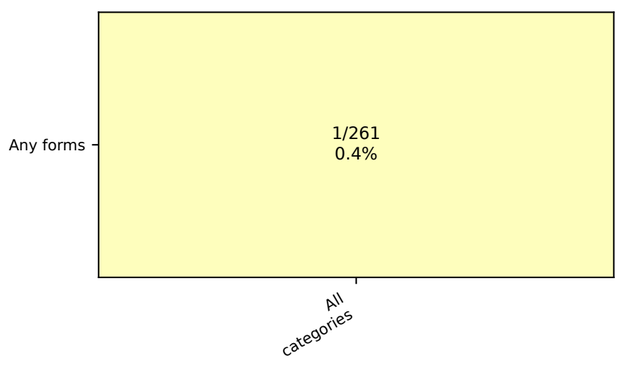

No additional contexts pass the paper filters

(c) Bank account number
Overall 0/261 = 0.0%

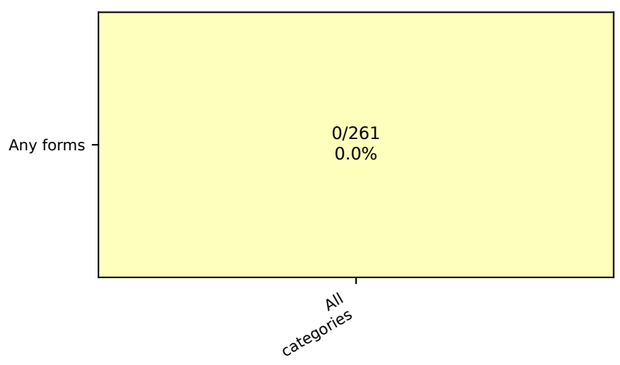

No additional contexts pass the paper filters

(d) Tax ID
Overall 1/261 = 0.4%

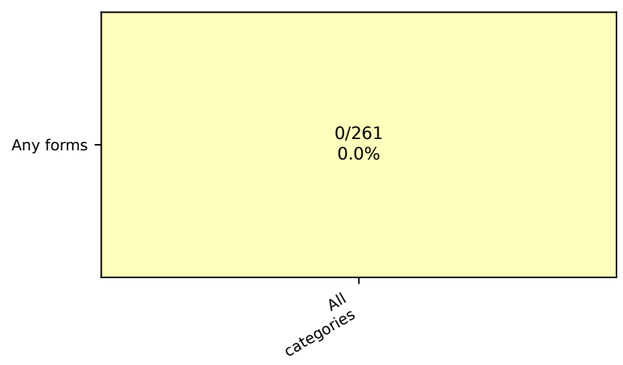

No additional contexts pass the paper filters

(e) Government ID
Overall 0/261 = 0.0%

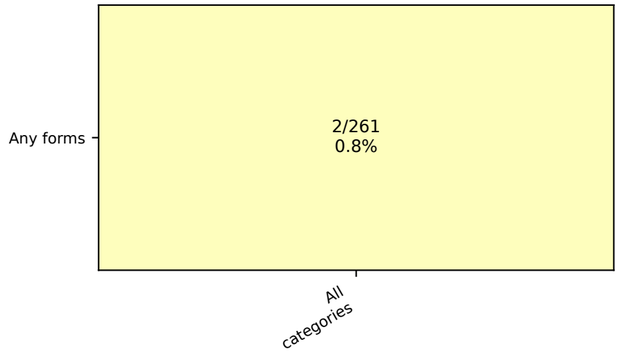

No additional contexts pass the paper filters

(f) Gender
Overall 0/261 = 0.0%

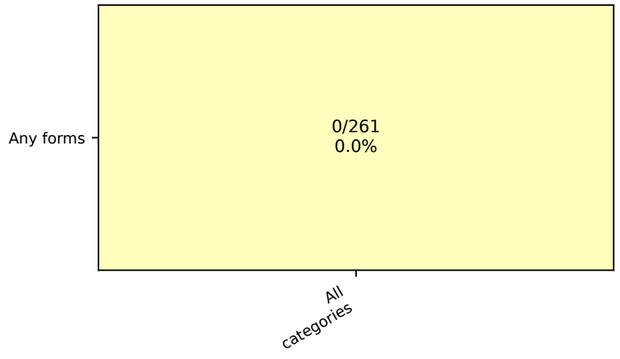

No additional contexts pass the paper filters

(g) Citizenship / immigration status
Overall 2/261 = 0.8%

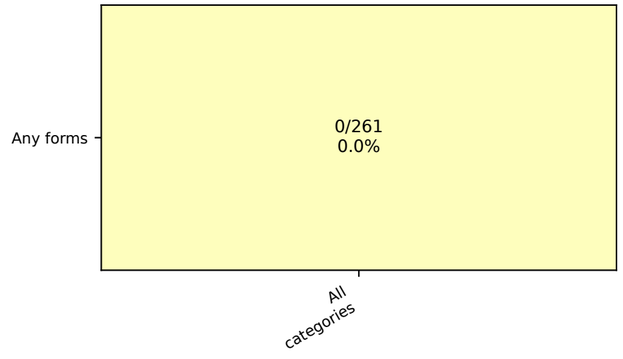

No additional contexts pass the paper filters

(h) Ethnicity
Overall 0/261 = 0.0%

No additional contexts pass the paper filters

(i) Military status
Overall 0/261 = 0.0%

No additional contexts pass the paper filters

Cells show collecting domains / context domains and percentage. Gray = masked, never a confirmed zero.
Paper notebook filters: context n >= 10, unadjusted Welch p < 0.05, keep rows/columns with a retained rate above the overall rate.
Colors: red 0x, yellow 1x, green 2x overall rate. A zero overall rate has no defined relative color and is shown neutrally.
Sparse, overlapping contexts and annotation uncertainty limit interpretation. These tests do not compare historical with European outcomes.
